Errata/Omissions in the *PEW* User Manual

p.5 Release Contents and Installation

Two files have been added: *PEWDEMO.DAT* containing a demonstration script for the *PEW*, and *DEMO.BAT*, a batch file which runs the demonstration.

p.7 The Main Menu

From 4th last line ("If one of...") to last line ("...to select a menu item.") is much clearer if read as "If one of the two submenus (*File* or *Options*) is invoked, and subsequently exited by pressing *ESC*, you will be placed on the main menu but the submenu will close. You can then move around the main menu with the left and right cursor keys, and press *ENTER* to select a main menu item."

p. 25

Last paragraph, 3rd line: "This example..." to 4th last line "...network body type." is incorrect. This sentence should read: "This example shows three breakpoints: the first is set on the $ack\_wait \rightarrow ack\_wait$ transition of the *alternating_bit[1]* process being enabled; the second is a breakpoint on an *Output* statement to the n interaction point of all processes having the *alternating_bit* body type, and the third is a line breakpoint set on line 165." Note that suspended breakpoints are displayed with parentheses about their numbers in the breakpoint browser.

p28. Some more figures

- Program size: 145kB (+7kB errors + 30kB help)

- *PEW* help screens: 98

- Language help: 34 screens indexed on 46 keys

- Maximum number of *failed* When clauses per process: 32

p36. Stack overflow

As E-Code is stack-based all variables are allocated on the stack. This should be borne in mind when declaring variables, as stack space is limited.

p36. Too many failed WHEN clauses in process

The maximum number allowed of failed When clauses within a single process is 32.
